The banana bubble!

There are rumblings of a storm, but 2013 has been a powerful anticyclone for the European market. Helped out by the lack of competition, the banana for a time became the main attraction on the shelves. But beware, reality could bite back all the harder!

Summary

Almost perfect!
Fewer apples is a good thing, but fewer Goldens is even better!
Other less decisive factors
Down to earth!
Left to fend for itself
Added value: stop the massacre!
2014 set to be a long year

2013 was an almost perfect year for the banana! Just five short weeks in autumn were all that was missing to round off a year, which apparently without that mishap would have gone into the record book. We will take a longer look at the performances in terms of consumption in the traditional April edition of FruiTrop, once all the quantitative data are available and have been processed. However, you can bet that 2013 has been an exceptional year. As at the end of October, the estimated European consumption was up 4% over ten months and 3% over the last twelve months (November 2012 to October 2013). The end of the year saw the phenomenon intensify further. And just this once, 2013 was also exceptional in terms of green banana price. For France, the green banana price (source: CIRAD) amounted to 0.69 euro/kg, i.e. 12.5 euros/box, the second best performance for eight years, just short of 2012, another year out of the ordinary. So we observed a slight fall in green banana price (-2% in France and -4% on our EU barometer), but the comparison with 2012 is misleading since this was a record year. Compared to 2011, we can regard the levels obtained in 2013 as satisfactory: +7%, both for the French green banana price and for the European price.

These two successive years have not necessarily followed the same pattern. The season profiles differ in particular on two points: the very good durability of rates during summer 2013, a very high risk period, which was not the case in 2012, and a disastrous autumn 2013, whereas in 2012, after the miserable summer came a strong recovery which lasted until the end of the year. This favourable trend was confirmed over the first nine months of 2013. So we have had two different behaviours with two very close annual averages: 0.69 euro/kg in 2013 and 0.71 euro/kg in 2012.

The convergence of the annual prices was accompanied by very low volatility in rates over these two years. From 1.49 euro/box in 2012, the volatility (in this case represented by the standard deviation calculated for the French green banana weekly price series) fell to 1.14 euro/box in 2013. This is moreover the lowest deviation ever recorded in France. Rounded to the annual average price, the variation observed was just 9%, as opposed to 12% in 2012 and 22% in 2011. It would be hard to find a better market, with a stable, relatively satisfactory green banana price and high consumption: some kind of year of wonders for the banana! So we have found the magic elixir, and a vaccination against nightmares is within reach. All this, moreover, in a hostile regulatory environment (elimination of restrictions and
scheduled reduction in customs duty) and on a European market increasingly open to international competition.

This is of course the optimistic version of the analysis. Since the devil is in the details, let’s look closer at the success, and separate what is down to the structural context from what is dependent on the short-term context. So be prepared for disappointment.

Fewer apples is a good thing, but fewer Goldens is even better!

As you will have realised, the conclusions are more than nuanced. We might even consider that 2013 highlights the great difficulties of the sector. Since while we have to celebrate the good banana year, it is actually only down to a combination of one-off, or even miraculous, short-term effects. First and foremost we need to look outside of the banana sector to find the truth.

First let’s stay within the fruits sector, since it has made the biggest contribution to things going well. The apple sector, and, more secondarily, the pear sector, had a heavy impact on the market. The French Ministry of Agriculture’s business outlook bulletin ("Agreste Conjoncture"), issued in March 2013, could not be clearer: “2012 production is reportedly 25 % down on the past five years, which is the smallest French harvest observed for ten years.” We can also read from the price evolution that “since the beginning of the season [September 2012], rates are much higher than the 2007-2011 average rates: between + 20 % and + 51 %, depending on the month.” Although France saw the biggest slowdown in production volume in 2012 (- 32 %) because of major weather damage, the situation deteriorated greatly in other EU countries, with European production falling 9 %, and by as much as - 24 % for Spain for instance. Eastern Europe bucked the trend, with its production jumping by 11 % from 2011.

What we also need to bear in mind from the 2012 European apple season is the steep fall (- 12 %) in Golden Delicious production, which represents the biggest of the European players with 23 % of the supply, and which is still a staple on the shelves. This is a significant detail, since the banana is also a staple of the staples on the shelves. Consequently, when Goldens is less abundant, it is a highly competitive segment for the banana, which weakens. Citruses are also a very big competitor for the banana, especially in periods supposedly the most auspicious for our fruit: autumn and winter. Eric Imbert, economist and head of the citrus sector within the CIRAD Market News Service, provided in the November edition of FruiTrop his analysis of the 2012-13 citrus season: “Thanks to these moderate volumes and a demand taking advantage of the scarcity of the European apple supply, most exporter countries in the zone [Mediterranean] had been able to re-establish a satisfactory profitability level.” Fewer apples, fewer citruses, all that remained was to clear the hurdle of summer 2013. Once again, the skies came to the aid of the banana producers. According to Agreste, the combination of a reduced supply (of peaches and nectarines) caused by the vagaries of spring weather and consumption boosted by the often high summer temperatures (July) led to an increase in rates, both in France and the EU.
Other less decisive factors

Other factors have also affected the competitiveness and attractiveness of the banana on the European market. Hence the euro/dollar exchange rate throughout 2013 remained within a range of between 1.28 and 1.40 USD to the euro, with the euro tending to strengthen at the end of the period. However, for the market balance, we can nonetheless be glad that the euro did not generate any additional competitiveness margins for dollar production sources, unlike in 2011 and the three preceding years.

The growth of costs to their highest levels in 2013 (provisional CIRAD index 130, as opposed to 128 in 2012 and 127 in 2011) also hindered exporters less inclined to take risks on a spot market which is all about taking a gamble, with its high fixed costs. The guarantee of a high return level on all markets, very strong fruit demand at certain times of year and a relaxation in bunker prices and freight rate, however, mitigated this risk taking in 2013. So it is hard to draw conclusions as to the influence of the cost index on the supply level to a market which for a good part of the year remained highly dynamic.

Now for the climate, which is said to have a big effect on the dynamics of the banana market. If we refer to the Météo France analyses, which observes that the temperatures were below normal in the first half-year, with a very cold May, we might think that this supported consumption, already lively for the reasons mentioned above, and conversely, that the cold temperatures and generally short sunshine duration held back spring and summer fruit harvests and their consumption. Météo France emphasised that July and October were particularly warm, doubtless a factor aggravating the supply crisis that France and Europe went through in October (see below).

Apples and pears made way, and stone fruits and citruses were out of the picture; temperatures were rather favourable for banana consumption; no excesses on delivery costs or costs in general; supply barely affected by the euro/dollar exchange rate. In short, the banana industry was enjoying an idyll, along the lines of “Cast Away”! We could leave the explanations there, and make the indisputable observation that autumn 2012–summer 2013 was a waking dream...

Down to earth!

Except that the real world, where nothing lasts forever, and where conditions are constantly shifting, gave us a most fearsome and striking reminder: the five-week period from 41 to 45, i.e. between the second week of October and the first week of November 2013. The import prices in France all of a sudden came apart, falling below 0.60 euro/kg, a level never breached since the disastrous summer of 2012. We had to wait until week 46 for the machinery to get back into gear, to finish the year on a positive trend. The sky fell in on our heads, just like in the Asterix and Obelix comics, the latest edition of which came out during this crisis, in a wink to destiny.

While the findings are clear, the explanation is more difficult. Here too, we need to explore a combination of factors. The first is due to the intensity of the supply to the French market from Africa. While Côte d’Ivoire has regulary increased its volumes from a low point in early 2012, partly thanks to the gradual return to normal in terms of politics and reinvestment in planting, it is the behaviour of Cameroon which has attracted all the criticism. Whereas the source had been on the slide since the beginning of the year, its exports to France and Europe suddenly exploded in October 2013, from 8 000 to 16 000 tonnes from one month to the next for France, and from 17 000 to 24 000 tonnes for the EU-27. Whatever the sector, it is clearly tough to handle such a peak under good commercial conditions.

The return to a more measured supply level in November helped, among other things, to restore calm on the French market, but also on the European market. Indeed, the latter had once again been given a rough ride by the malfunctions of the French market. But the Cameroonian volumes do not of course explain everything. Other sources also increased their volumes in this period, such as Colombia with its traditional export peak to the EU, which quite precisely in October reached a total of more than 10 million boxes, before dropping back to 7 million the following month. This was also the case for the Dominican Republic, which recovered its best levels (31 000 tonnes in October) and Ecuador, which increased its exports to the EU by 18 % from one month to the next.

And then there was the interminable and languishing end to the summer fruits season, hindering the European market for weeks. Then come other more diffuse explanations, due primarily to the market atmosphere. Hence in a sort of collective hallucination, where the positive market trend has a powerful anaesthetic effect, we had all forgotten that the apple and pear season more or less comes back on the same date, that apple festivals flourish in the supermarkets, dislodging the banana and other products from prime shelf spots.

Furthermore, we can count ourselves lucky to have had a relatively average 2013-14 harvest, true well up (+ 11 %) on the disastrous year 2012, yet still around average for the past five years (+ 2 %). Furthermore, since the harvest was late, the massive promotions in the hypermarkets and supermarkets were also later, practically starting at the end of November. And what about the other heavyweight of the
market, citruses, and more particularly at this time of year, small citruses? Nothing doing! The season ranged from late to very late, with hot temperatures which held back the degreening process. The Mediterranean supply did not really grow until November, i.e. the month following the disruption.

After these notorious five weeks, the market recovered the annual trend, and ended 2013 on an overall positive note. The import turnover (supply level before re-exports multiplied by green banana price) for the French market alone confirmed this trend, since from January to October, i.e. taking into account the highly depressed month of October, it went up by 36 million euros from the same period of 2012, to reach practically the half-billion euro mark.

Left to fend for itself

What are the big lessons that we can take from this year, once more atypical? The most important which, admittedly, is not really revolutionary, is the extreme sensitivity of the market to the supply of competing products. The banana market remains trapped, and dependent on external factors. This is not very reassuring for its future. Since as has been clear since 2012, it has not proven profitable due to the actions taken by the sector itself (industry structuring, sales coordination, targeted promotions, etc.), but because more or less serious
The second lesson, just as tragically blatant and mundane, is that the market is very sensitive to a banana over- or under-supply. Indeed, twice in 2013, one time in one direction with a reduction of the Martinique supply due to cyclone Chantal in early 2013, and the other time when the supply exploded in October, we saw the market react abruptly and sometimes even to exaggerated degrees.

In summary, while we can celebrate a relatively quiet year for the banana, which saw its rate rise throughout practically the whole year, in no way should it lead us to believe that the balance has finally been achieved. Indeed, the good economic conditions of 2012 and 2013 have only very little to do with the actual workings of the market, and still less with its fundamentals. To think otherwise would be the gravest of illusions. The banana supply is unregulated, and demand depends on the supply of competing products (inside and outside the fruits and vegetables sector). The international supply is subject to the evolution of euro/dollar exchange rates and the cost price (especially the energy price). The absorption capacity of the US market (fortunately good), but also that of the Russian market (highly volatile), are the pillars of the world market. But the situation is fragile. The political decisions which have a big impact on the relative competitiveness between suppliers, and about which the operators cannot really do anything, are also an unmanageable risk factor. The reduction in the customs fees for Latin American sources has actually been largely ratified, and scheduled for the medium term. Then we have the factor on which everyone agrees: the weather vagaries, the frequency and intensity of which savagely and dramatically regulate the global balances.

Added value: stop the massacre!

More generally, and to avoid piling illusion on illusion, we also need to know whether the balance, even if artificial as at present, generates added value, or at least helps prop up a structurally sickly sector. At the beginning of last year, we had shown that 2012 had enabled added value to regain the lost ground, to some extent eliminating the slow decline caused by inflation. Unfortunately, given the considerable fall in the green banana price and inflation, though moderate at 0.8 %, we can consider that value crumbled in 2013. In other words, the banana is not following the overall increase of French as a whole (inflation rate). The value (in constant euros) of the product reached in 2013 the level that it had in… 2006. Some progress! This is one of the most relevant indicators for demonstrating the extreme commoditisation of this product. And it is better not to make the same calculation taking the consumption price index for the fruits sector alone. The scissor effect between constant price and going price is at its greatest in that case. In 2013, the constant value of the banana was 7 % below its 2006 level.

The good news is that the banana is relatively less expensive than other fruits. But what sense does that make? Since in this little game, the banana has long since knocked out the competition, without housewives rushing out to buy any more. That is where the pinch is felt. So the solution is not to destroy value to gain market share.

The analysis made possible by the precious economic data collated by the RNM (market news network), especially at the shipment stage (for French fruits), could reassure banana operators. Indeed, if in the kingdom of the blind the one-eyed man is king, then the banana does no worse than the other fruits, but there are two major remarks: its price evolution is impressively stable in current euros, and it is ranked among the low added-value fruits such as the Golden apple or orange.
2014 set to be a long year

So now is the time to make the projections for 2014. This is obviously a tough exercise after what we have just been saying. The fact remains that certain fundamentals are now practically definite. On the one side, we know for example that the production capacities in Central and South America are intact, having avoided serious weather damage. We also know that Martinique will return to full production in the first half of 2014. Although its weight on the European market is relatively light, it is fundamental on the French market. Furthermore, Africa is conducting a development policy, either by improving its current capacities, or by expanding surface areas, the real effects of which, it is true, will only be visible in a few years’ time (see FruiTrop 216, November 2013, p. 12). In the short term, the weather conditions in Africa have been rather favourable for banana production in the past few months. Finally, euro/dollar parity will remain, whatever happens, favourable to exporters to the EU, and we could even see the euro rise against the dollar, due to the end of the accommodating monetary policy in the United States.

On the flip side, with the global economic recovery, though listless, we could see some tensions on the raw materials market, especially for the price of energy, which has a very heavy impact on the cost of a box of bananas. Thus the big exporters could be forced to closely monitor their production returns. Yet one of the great unknowns remains the relative presence or relative absence of competing spring and summer products: strawberry, apricot, peach and nectarine. We will just have to hope, as the old French saying goes that: “if it snows on Saint Onesimus day (16 February) then the harvest will be ruined.”

More seriously, how can we be optimistic about 2014? The operators questioned can find nothing to reassure them, since while the banana market is atypically high (which is really characteristic), they are too afraid of what everyone has been promising them since the opening of the European market in 2006: the cataclysm. There is what many believe is a structural factor for the European and world markets: development of contractualisation or, at least, of setting a guideline price (such as Aldi applies) over a relatively long period (a quarter). It is hard to get a clear opinion about the question. The near-generalised contractualisation in the United Kingdom, going as far as to bring together all the links of the industry, raises questions as to producer returns. Certain Colombian cooperatives, fair trade certified at that, do not seem particularly satisfied with the system. The “Aldi” process has its advocates and detractors. Since the Aldi price level is fixed rather at the bottom of the range (this is the case for the first quarter of 2014), certain observers hope that this will help remove the worst and most modest operators, and leave the field free for the others. Banking on their doubtless better adaptability and resistance, the biggest suppliers to the German discount supermarket are advocating a more extensive market structuring to their own advantage: reducing the number of players. Others believe that setting an import price three months in advance is a tall order on a market extremely sensitive to all kinds of vagaries. And furthermore, that the system is more rigid and closed to price increase processes. In short, that it is carved up by and for the distribution sector rather than for the upstream operator.

In every case in 2014, exporters who have opted for a fixed contractualised sale price for a season will apply caution and good stewardship of their company. In case of a disaster on the market, they will need to monitor the damage reports, the traditional route for the fruits and vegetables sector to escape the contract conditions.

The banana bubble of recent years has led many operators to explore new frontiers in production, and believe that the balances had been achieved. At the risk of banging on, we should recall that the increase in banana consumption seen in 2012 and 2013 in Europe is indeed real, but that the battle was won unopposed.
